```

[illegible] if [illegible] (if [illegible] else) [illegible] x / 2 [illegible] ; [illegible] .[illegible]

An if expression should be used in the same way as the other expressions. For example, when it is used in a let statement, the statement must be terminated with a ; as well. Remove .the ; before println! to see the compiler error

6.2 [illegible]

[illegible] Rust [illegible]: ”loop” [illegible] ”while” [illegible] ”for”:

[illegible] while

[illegible]while [illegible].

```
                                  } ()fn main
                    ;let mut x = 200
                     } while x >= 10
                      ;x = x / 2
                                    {
          ;("{x: {x [illegible]")!println
                                        {
```

6.2.1 for

[illegible] for [illegible]:

```
                                  } ()fn main
                     } for x in 1..5
             ;("{println!("x: {x
                                    {

         } [for elem in [1, 2, 3, 4, 5
         ;("{println!("elem: {elem
                                    {
                                        {
```

- «for» [illegible] «[illegible]» [illegible] Iterators [illegible].
- [illegible] for [illegible] 4 [illegible] 5=..1 [illegible].

6.2.2 loop

loop [illegible] «break» [illegible].

```
                                  } ()fn main
                       ;let mut i = 0
                                  } loop
                           ;i += 1
```

```
;("{println!("{i
    } if i > 100
      ;break
               {
                   {
                       {
```

continue [illegible] break 6.3

.[illegible] `continue` [illegible]

If you want to exit any kind of loop early, use `break`. With `loop`, this can take an optional .expression that becomes the value of the `loop` expression

```
               } ()fn main
        ;let mut i = 0
                } loop
           ;i += 1
        } if i > 5
        ;break
                 {
   } if i % 2 == 0
     ;continue
                 {
;(println!("{}", i
                     {
                         {
```

Note that `loop` is the only looping construct which can return a non-trivial value. This is because it's guaranteed to only return at a `break` statement (unlike `while` and `for` loops, .(which can also return when the condition fails

[illegible] 6.3.1

(label) [illegible] `break` [illegible] `continue` [illegible] :[illegible]

```
                                          } ()fn main
   ;[[let s = [[5, 6, 7], [8, 9, 10], [21, 15, 32
                   ;let mut elements_searched = 0
                           ;let target_value = 10
                         } outer: for i in 0..=2'
                             } for j in 0..=2
                  ;elements_searched += 1
             } if s[i][j] == target_value
                        ;break 'outer
                                        {
                                            {
                                                {
;("{print!("elements searched: {elements_searched
                                                    {
```

6.4 [illegible]

[illegible]

[illegible] Rust [illegible] «{}» [illegible]. [illegible]:

```rust
fn main() {
    let z = 13;
    let x = {
        let y = 10;
        println!("y: {y}");
        z - y
    };
    println!("x: {x}");
}
```

[illegible] `;` [illegible] `()` [illegible].

- [illegible]. [illegible] `;` [illegible] `return` [illegible].

6.4.1 [illegible]

[illegible] (scope) [illegible].

[illegible]:

```rust
fn main() {
    let a = 10;
    println!("before: {a}");
    {
        let a = "hello";
        println!("inner scope: {a}");

        let a = true;
        println!("shadowed in inner scope: {a}");
    }

    println!("after: {a}");
}
```

- [illegible] «b» [illegible].
- Shadowing is different from mutation, because after shadowing both variables' memory locations exist at the same time. Both are available under the same name, depending where you use it in the code.
- [illegible].
- [illegible] `.unwrap()`

[illegible].

6.5 [illegible]

```
fn gcd(a: u32, b: u32) -> u32 {
    if b > 0 {
        gcd(b, a % b)
    } else {
        a
    }
}

fn main() {
    println!("gcd: {}", gcd(143, 52));
}
```

- [illegible] ([illegible] [illegible]).
- [illegible] ([illegible]) [illegible]. [illegible]

  ;

  [illegible].
- Some functions have no return value, and return the 'unit type', `()`. The compiler will infer this if the return type is omitted.
- [illegible] (overloading) [illegible] -- [illegible].
  - [illegible]. [illegible]. [illegible].
  - [illegible].

} ()fn main
;("{println!("{BANNER
{
```

As noted in the Rust RFC Book, these are not inlined upon use and have an actual associated memory location. This is useful for unsafe and embedded code, and the variable lives through the entirety of the program execution. When a globally-scoped value does not have a reason .to need object identity, `const` is generally preferred

- .++`static` is similar to mutable global variables in C
- `static` [illegible] [illegible] [illegible] [illegible] [illegible]: [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible]

  `<Mutex<T`

  .[illegible] [illegible] [illegible]

[illegible] [illegible] [illegible]

Because `static` variables are accessible from any thread, they must be `Sync`. Interior .mutability is possible through a `Mutex`, atomic or similar

.Thread-local data can be created with the macro `std::thread_local`

                               ;{ let p1 = Point { x: 10, y: 20
                             ;{ let p2 = Point { x: 100, y: 200
                ;(println!("{:?} + {:?} = {:?}", p1, p2, p1 + p2
                                                              {
```

[illegible]:

- Add [illegible] &Point [illegible].
  – [illegible]: Add::add [illegible] self [illegible]. [illegible] T [illegible] Copy [illegible] &T [illegible].
- Output [illegible]
  – [illegible]: [illegible] (Output [illegible]) [illegible] trait [illegible].
- Add [illegible] impl Add<(i32, i32)> for Point [illegible] tuple [illegible] Point [illegible].

The Not trait (`!` operator) is notable because it does not ”boolify” like the same operator in C-family languages; instead, for integer types it negates each bit of the number, which arithmetically is equivalent to subtracting it from -1: `!5 == -6`.

17.3 From and Into

Types implement `From` and `Into` to facilitate type conversions. Unlike `as`, these traits correspond to lossless, infallible conversions.

```
                                                  } ()fn main
                              ;("let s = String::from("hello
                 ;([let addr = std::net::Ipv4Addr::from([127, 0, 0, 1
                                  ;(let one = i16::from(true
                              ;(let bigger = i32::from(123_i16
                        ;("{println!("{s}, {addr}, {one}, {bigger
                                                              {
```

`Into` [illegible] `From` [illegible]:

```
                                                  } ()fn main
                              ;()let s: String = "hello".into
               ;()let addr: std::net::Ipv4Addr = [127, 0, 0, 1].into
                                  ;()let one: i16 = true.into
                            ;()let bigger: i32 = 123_i16.into
                        ;("{println!("{s}, {addr}, {one}, {bigger
                                                              {
```

- [illegible] From [illegible] Into [illegible].
- [illegible] ”[illegible] String [illegible]” [illegible] Into [illegible]. [illegible] From [illegible] Into [illegible].

17.4 Casting

Rust [illegible] *implicit* [illegible] as [illegible]. [illegible] C [illegible].

```rust
fn main() {
    let value: i64 = 1000;
    println!("as u16: {}", value as u16);
    println!("as i16: {}", value as i16);
    println!("as u8: {}", value as u8);
}
```

[illegible] as [illegible] Rust [illegible]. [illegible] -- [illegible].

[illegible] as [illegible]. [illegible] ([illegible] 32 [illegible] u32 [illegible] u64 as [illegible]).

[illegible] ([illegible] u32 [illegible] u64) [illegible] From [illegible] Into [illegible] as [illegible]. [illegible] TryFrom [illegible] TryInto [illegible].

[illegible].

as [illegible] static_cast [illegible] C++ [illegible]. [illegible] as [illegible].

[illegible] usize [illegible].

17.5 Read and Write

[illegible] Read [illegible] BufRead [illegible] u8 [illegible]:

```rust
use std::io::{BufRead, BufReader, Read, Result};

fn count_lines<R: Read>(reader: R) -> usize {
    let buf_reader = BufReader::new(reader);
    buf_reader.lines().count()
}

fn main() -> Result<()> {
    let slice: &[u8] = b"foo\nbar\nbaz\n";
```

```
       ;((println!("lines in slice: {}", count_lines(slice

;?(?()let file = std::fs::File::open(std::env::current_exe
         ;((println!("lines in file: {}", count_lines(file
                                                    (())Ok
                                                             {
```

:□□□□□ □□□□□□□ u8 □□□□□□ □□□□ □□ □□ □□□□□□ □□□□□□ □□□□ □□ Write □□□□□□□ □□□□ □□

```
                              ;{use std::io::{Result, Write

{
```

An Fn (e.g. add_3) neither consumes nor mutates captured values. It can be called needing only a shared reference to the closure, which means the closure can be executed repeatedly .and even concurrently

An `FnMut` (e.g. `accumulate`) might mutate captured values. The closure object is accessed .via exclusive reference, so it can be called repeatedly but not concurrently

If you have an `FnOnce` (e.g. `multiply_sum`), you may only call it once. Doing so consumes .the closure and any values captured by move

```

- [illegible].

22.4 [illegible]

[illegible] ([illegible]) [illegible].

[illegible]) [illegible] (interior mutability) ”[illegible]” [illegible] [illegible] .[illegible] ([illegible] [illegible] .[illegible]

Cell

`Cell` wraps a value and allows getting or setting the value using only a shared reference to the `Cell`. However, it does not allow any references to the inner value. Since there are no .references, borrowing rules cannot be broken

```
;use std::cell::Cell

} ()fn main
    .Note that `cell` is NOT declared as mutable //
    ;(let cell = Cell::new(5

    ;(cell.set(123
    ;(()println!("{}", cell.get
{
```

RefCell

`RefCell` allows accessing and mutating a wrapped value by providing alternative types `Ref` .and `RefMut` that emulate `&T`/`&mut T` without actually being Rust references

[illegible] dynamic [illegible] `RefCell` [illegible] type [illegible] .[illegible] `Ref`/`RefMut` [illegible] `RefMut` [illegible]

[illegible] (`RefMut` [illegible] `DerefMut` [illegible]) `Deref` [illegible] .[illegible]

```
;use std::cell::RefCell

} ()fn main
    .Note that `cell` is NOT declared as mutable //
    ;(let cell = RefCell::new(5

    }
        ;()let mut cell_ref = cell.borrow_mut
        ;cell_ref = 123*

        .This triggers an error at runtime //
        ;()let other = cell.borrow //
        ;(println!("{}", *other //
    {

    ;("{?:println!("{cell
{

28 □□□

□□□ □□□

Including 10 minute breaks, this session should take about 2 hours and 15 minutes. It contains:

□□□	□□□□ □□□
□□□ □□□□□□	□□□□ □
□□□□□□Rust	□□□□□ □ □ □□□□

29 [illegible]

[illegible]

[illegible]:

[illegible]	[illegible]
Panic [illegible]	[illegible]
Result	[illegible]
Try [illegible]	[illegible]
[illegible] (Conversions) [illegible]	[illegible]
Error Trait	[illegible]
anyhow [illegible] thiserror	[illegible]
[illegible]: Result [illegible]	[illegible]

29.1 [illegible] Panic

Rust [illegible] ”panic“ [illegible].

[illegible] Rust [illegible] panic [illegible]:

```
} ()fn main
    ;[let v = vec![10, 20, 30
    ;([println!("v[100]: {}", v[100
{
```

- [illegible] Panic [illegible].
  - [illegible].
  - [illegible] failed bounds check [illegible] panic [illegible]
  - Assertions (such as `assert!`) panic on failure
  - [illegible] `panic!` [illegible].
- panic [illegible] ”[illegible]“ [illegible].
- [illegible] API [illegible] panic (`Vec::get` [illegible]) [illegible].

[illegible] panic [illegible] unwind [illegible] stack. unwinding [illegible] ([illegible] caught [illegible]):

```rust
use std::panic;

fn main() {
    let result = panic::catch_unwind(|| "[illegible]!");
    println!("{result:?}");

    let result = panic::catch_unwind(|| {
        panic!("oh no!");
    });
    println!("{result:?}");
}
```

- [illegible] (Catching) [illegible]. [illegible] exception[illegible] `catch_unwind` [illegible]-[illegible]!
- [illegible].
- [illegible] `'panic = 'abort` [illegible] `Cargo.toml`[illegible].

29.2 Result

[illegible] Rust[illegible] `Result` [illegible].

```rust
use std::fs::File;
use std::io::Read;

fn main() {
    let file: Result<File, std::io::Error> = File::open("diary.txt");
    match file {
        Ok(mut file) => {
            let mut contents = String::new();
            if let Ok(bytes) = file.read_to_string(&mut contents) {
                println!("[illegible]: {contents} ({bytes} bytes)");
            } else {
                println!("[illegible]");
            }
        }
        Err(err) => {
            println!("[illegible]: {err}");
        }
    }
}
```

- `Result` has two variants: `Ok` which contains the success value, and `Err` which contains an error value of some kind.
- [illegible] signature [illegible] `Result` [illegible].
- [illegible] `Option`[illegible] `Result` [illegible]. [illegible] `unwrap`[illegible]

[illegible].

[illegible]

[illegible] Rust [illegible].

[illegible]

- [illegible] exception [illegible] .C++ [illegible].
- [illegible] exception [illegible] (signature) [illegible] exception [illegible].
- [illegible] call stack [illegible] try [illegible] call stack [illegible].

[illegible]

- [illegible] ([illegible]) [illegible] C [illegible] Go [illegible].
- [illegible].

29.3 Try [illegible]

[illegible] connection-refused [illegible] file-not-found [illegible] «[illegible]» [illegible]-[illegible] ? [illegible].

```
match some_expression {
    Ok(value) => value,
    Err(err) => return Err(err),
}
```

[illegible]

```

30.4 [illegible] [illegible] [illegible]

[illegible] Union[illegible] [illegible] enum[illegible] [illegible] [illegible] [illegible] [illegible] [illegible] active field [illegible] [illegible] [illegible]:

```rust
union MyUnion {
    i: u8,
    b: bool,
}

fn main() {
    let u = MyUnion { i: 42 };
    println!("int: {}", unsafe { u.i });
    println!("bool: {}", unsafe { u.b }); // Undefined behavior
}
```

[illegible] Union [illegible] Rust [illegible] enum [illegible]. [illegible] API [illegible] C [illegible].

[illegible] mem::transmute](https://doc.rust-lang.org/stable/std/mem/fn.transmute.html [illegible] ([illegible] safe wrapper [illegible] zerocopy](https://crates.io/crates/zerocopy)).

30.5 [illegible]

[illegible]

[illegible] function [illegible] method [illegible] unsafe [illegible]:

```
extern "C" {
    fn abs(input: i32) -> i32;
}

fn main() {
    let emojis = "🗻∈🌏";

    // SAFETY: The indices are in the correct order, within the bounds of the
    // string slice, and lie on UTF-8 sequence boundaries.
    unsafe {
        println!("emoji: {}", emojis.get_unchecked(0..4));
        println!("emoji: {}", emojis.get_unchecked(4..7));
        println!("emoji: {}", emojis.get_unchecked(7..11));
    }

    println!("char count: {}", count_chars(unsafe { emojis.get_unchecked(0..7) }));

    // SAFETY: `abs` doesn't deal with pointers and doesn't have any safety
    // requirements.
    unsafe {
        println!("[illegible] -3 [illegible] C: {}", abs(-3));
    }

    // Not upholding the UTF-8 encoding requirement breaks memory safety!
    // println!("emoji: {}", unsafe { emojis.get_unchecked(0..3) });
    // println!("char count: {}", count_chars(unsafe {
    // emojis.get_unchecked(0..3) }));
}

fn count_chars(s: &str) -> usize {
    s.chars().count()
}
```

[illegible]

[illegible] unsafe[illegible].

```
/// Swaps the values pointed to by the given pointers.
///
/// # Safety
///
/// The pointers must be valid and properly aligned.
unsafe fn swap(a: *mut u8, b: *mut u8) {
    let temp = *a;
    *a = *b;
    *b = temp;
}

fn main() {
    let mut a = 42;
    let mut b = 66;

    // SAFETY: ...
    unsafe {
        swap(&mut a, &mut b);
    }

    println!("a = {}, b = {}", a, b);
}
```

[illegible]

[illegible] "C" [illegible] ABI [illegible]. ABI[illegible].

[illegible]

[illegible] pointer[illegible] swap[illegible] - [illegible] reference[illegible].

[illegible] unsafe [illegible]. [illegible] #[deny(unsafe_op_in_unsafe_fn)] [illegible]. [illegible] Rust [illegible].

30.6 [illegible] (Traits) [illegible]

[illegible] unsafe [illegible].

[illegible] zerocopy crate [illegible]:

```
use std::mem::size_of_val;
use std::slice;
```

```
/// ...
/// # Safety
/// The type must have a defined representation and no padding.
pub unsafe trait AsBytes {
    fn as_bytes(&self) -> &[u8] {
        unsafe {
            slice::from_raw_parts(
                self as *const Self as *const u8,
                size_of_val(self),
            )
        }
    }
}

// SAFETY: `u32` has a defined representation and no padding.
unsafe impl AsBytes for u32 {}
```

[illegible] `# Safety` [illegible] Rustdoc [illegible] (trait) [illegible] trait [illegible].

[illegible] `AsBytes` [illegible].

[illegible] `Send` [illegible] `Sync` [illegible] (unsafe) [illegible].

30.7 [illegible] FFI Wrapper

[illegible] Rust [illegible] *foreign function interface* (FFI) [illegible]. [illegible] `libc` [illegible] C [illegible].

[illegible]:

- `opendir(3)`
- `readdir(3)`
- `closedir(3)`

[illegible] `std::ffi` [illegible]

[illegible]	[illegible]	[illegible]
`str` [illegible] `String`	UTF-8	[illegible] Rust
`CStr` and `CString`	NUL-terminated	[illegible] C
`OsStr` [illegible] `OsString`	[illegible]	[illegible]

[illegible] type [illegible]:

- `&str` to `CString`: you need to allocate space for a trailing `\0` character,
- `CString` [illegible] `*const i8`: [illegible] C [illegible],
- [illegible] `*const i8` [illegible] `&CStr`: [illegible] `\0` [illegible],
- `&CStr` [illegible] `&[u8]`: [illegible] slice [illegible] universal interface [illegible] «[illegible]» [illegible]

- [illegible] &[u8] [illegible] &OsStr: OsStr [illegible] OsString [illegible] OsStrExt [illegible]
- &OsStr to OsString: you need to clone the data in &OsStr to be able to return it and call readdir again.

[illegible] Nomicon [illegible] FFI [illegible].

[illegible] https://play.rust-lang.org/ [illegible]:

- [illegible] exception [illegible] log [illegible].
- We can think of exception handlers and our main execution context more or less like different threads. Send and Sync will control what we can share between them, just like with threads. For example, if we want to share some value between exception handlers and the rest of the program, and it's Send but not Sync, then we'll need to wrap it in something like a `Mutex` and put it in a static.

- [illegible] RaspberryPi، [illegible] Rust [illegible] MMU [illegible]. [illegible] memory [illegible] (stack [illegible]). [illegible]:
  - Without the MMU and cache, unaligned accesses will fault. It builds with `aarch64-unknown-none` which sets `+strict-align` to prevent the compiler generating unaligned accesses so it should be alright, but this is not necessarily the case in general.
  - If it were running in a VM, this can lead to cache coherency issues. The problem is that the VM is accessing memory directly with the cache disabled, while the host has cacheable aliases to the same memory. Even if the host doesn't explicitly access the memory, speculative accesses can lead to cache fills, and then changes from one or the other will get lost. Again this is alright in this particular case (running directly on the hardware with no hypervisor), but isn't a good pattern in general.

endm.

**/
This is a generic handler for exceptions taken at the current EL while using *
SP0. It behaves similarly to the SPx case by first switching to SPx, doing *
.the work, then switching back to SP0 before returning *
*
Switching to SPx and calling the Rust handler takes 16 instructions. To *
restore and return we need an additional 16 instructions, so we can implement *
.the whole handler within the allotted 32 instructions *
/*
macro current_exception_sp0 handler:req.
msr spsel, #1
save_volatile_to_stack
bl \handler
restore_volatile_from_stack
msr spsel, #0
eret
endm.

**/
This is a generic handler for exceptions taken at the current EL while using *
SPx. It saves volatile registers, calls the Rust handler, restores volatile *
.registers, then returns *
*
This also works for exceptions taken from EL0, if we don't care about *
.non-volatile registers *
*
Saving state and jumping to the Rust handler takes 15 instructions, and *
restoring and returning also takes 15 instructions, so we can fit the whole *
```

```
.handler in 30 instructions, under the limit of 32 *
/*
macro current_exception_spx handler:req.
save_volatile_to_stack
bl \handler
restore_volatile_from_stack
eret
endm.

64.1 async/await

At a high level, async Rust code looks very much like ”normal” sequential code:

```rust
use futures::executor::block_on;

async fn count_to(count: i32) {
    for i in 0..count {
        println!("Count is: {i}!");
    }
}

async fn async_main(count: i32) {
    count_to(count).await;
}

fn main() {
    block_on(async_main(10));
}
```

[illegible]:

- [illegible] syntax [illegible]. [illegible] (concurrency) [illegible]!
- [illegible] async call [illegible]

main ;(let future: () = async_main(10 type   –
.

- •   .   Rust   syntax ”async”
.   future

- •
. async main future

- • block_on.   (executor)
.   future   thread

- •   .   (asyn)   await
.   thread await block_on

- •   block) async   await.
.(

Futures 64.2

                    object   trait Future
. Poll poll   poll future .

```
;use std::pin::Pin
;use std::task::Context

} pub trait Future
;type Output
;<fn poll(self: Pin<&mut Self>, cx: &mut Context<'_>) -> Poll<Self::Output
{

} <pub enum Poll<T
,(Ready(T
,Pending
{
```

 ( )   . impl Future async

64.3 Runtimes

[illegible] *runtime* [illegible] (_a_reactor) [illegible] future [illegible] (an *executor*) [illegible]. Rust [illegible] runtime [illegible]:

- Tokio: [illegible](performant)[illegible] Hyper [illegible] HTTP [illegible] [Tonic](https://github.com/hyperium/tonic) [illegible] gRPC.
- async-std: [illegible] "std for async" [illegible] runtime [illegible] `async::task` [illegible].
- smol: [illegible]

[illegible] (runtime) [illegible]. [illegible] Fuchsia [illegible] runtime [illegible].

- [illegible] Tokio [illegible] playground [illegible] Rust [illegible] playground. [illegible] (I/O) [illegible] async [illegible] playground [illegible].

- Future [illegible] «(inert)[illegible]» [illegible] ([illegible] I/O [illegible]) [illegible] (executor)[illegible] polling [illegible]. [illegible] JS Promises [illegible].

64.3.1 Tokio

Tokio provides:

- [illegible] runtime [illegible] multi-thread [illegible](asynchronous).
- [illegible] asynchronous version [illegible].
- [illegible].

```rust
use tokio::time;

async fn count_to(count: i32) {
    for i in 0..count {
        println!("[illegible] task: {i}!");
        time::sleep(time::Duration::from_millis(5)).await;
    }
}

async fn main() {
    tokio::spawn(count_to(10));

    for i in 0..5 {
        println!("Main task: {i}");
        time::sleep(time::Duration::from_millis(5)).await;
    }
}
```

- [illegible] `tokio::main` [illegible] `main` [illegible] async [illegible].

- [illegible] spawn [illegible] "task" [illegible].

- [illegible]: spawn [illegible] Future [illegible] `.await` [illegible] `count_to` [illegible].

- [illegible] `impl trait` [illegible] `async` [illegible] `dyn` [illegible].

If we do need dyn support, the crate async_trait provides a workaround through a macro, with some caveats:

```rust
use async_trait::async_trait;
use std::time::Instant;
use tokio::time::{sleep, Duration};

trait Sleeper {
    async fn sleep(&self);
}

struct FixedSleeper {
    sleep_ms: u64,
}

impl Sleeper for FixedSleeper {
    async fn sleep(&self) {
        sleep(Duration::from_millis(self.sleep_ms)).await;
    }
}

async fn run_all_sleepers_multiple_times(
    sleepers: Vec<Box<dyn Sleeper>>,
    n_times: usize,
) {
    for _ in 0..n_times {
        println!("running all sleepers..");
        for sleeper in &sleepers {
            let start = Instant::now();
            sleeper.sleep().await;
            println!("slept for {}ms", start.elapsed().as_millis());
        }
    }
}

async fn main() {
    let sleepers: Vec<Box<dyn Sleeper>> = vec![
        Box::new(FixedSleeper { sleep_ms: 50 }),
        Box::new(FixedSleeper { sleep_ms: 100 }),
    ];
    run_all_sleepers_multiple_times(sleepers, 5).await;
}
```

- [illegible] `async_trait` [illegible] heap allocation [illegible] heap allocation [illegible].
